## MINOW YOUR HTTP STATUS CODES!

HTTP status codes are returned in the response. They each consist of a three digit numerical code and a text description (the text description is simply advisory, and may be translated to other languages). The codes are categorized such that general classes of errors have the same most-significant digit, so if a client does not recognize a status code it may still infer the code's category.

## 1XX Informational

Status Code Description 100 Continue The server has received the request headers, and the client should begin to send the request body

The server has received a request to switch protocols and is doing so

102 Processing (WebDAV) Indicates that the server has received the request, used by WebDAV to avoid timeouts for long-running requests

2XX Success

101 Switching Protocols

Status Code Description 200 OK

Standard response for successful HTTP requests 201 Created The request was successful, and a new resource has been created

The request was accepted for processing, but the job hasn't actually been completed. It is possible that the request will be rejected once processing takes 202 Accepted

203 Non-Authoritative Information The request was successfully processed, but the returned information may be from an untrusted third party

204 No Content The request was processed and no content is being returned 206 Partial Content

Only part of the request body is being delivered (for example, when resuming an interrupted download) The message body is an XML document and may contain multiple status codes per sub-requests

The response has already been enumerated in a previous reply and will not be reported again

3XX Redirection

302 Found

403 Forbidden

404 Not Found

409 Conflict

410 Gone

405 Method Not Allowed

407 Proxy Authentication Required

406 Not Acceptable

408 Request Timeout

411 Length Required

412 Precondition Failed

417 Expectation Failed

423 Locked (WebDAV)

429 Too Many Requests

444 No Response (Nginx)

503 Service Unavailable

449 Retry With (Microsoft)

413 Request Entity Too Large

415 Unsupported Media Type

418 I'm a teapot (HTCPCP)

420 Enhance Your Calm (Twitter)

422 Unprocessable Entity (WebDAV)

424 Failed Dependency (WebDAV)

431 Request Header Fields Too Large

414 Request-URI Too Long

208 Already Reported (WebDAV)

207 Multi-Status (WebDAV)

Status Code Description Indicates that there are multiple locations which the client may follow 300 Multiple Choices

The resource has moved permantly, and all future requests should use the give URL instead 301 Moved Permanently

The resource has been found (or moved temporarily). The HTTP/1.0 specification requires that the redirect uses the same verb, but in practice clients use

a GET as in a 303. See 303 and 307

303 See Other The resource has been found, and should be accessed using a GET method. Added in HTTP/1.1 to clarify the ambiguity in the behavior of status 302. See

302 and 307

304 Not Modified The resource has not been modified since the last time the client has cached it

The resource should be accessed through a specified proxy 305 Use Proxy

307 Temporary Redirect The request should be repeated with the same request method at the given address. Added in HTTP/1.1 to clarify the ambiguity in the behavior of status

302. See 302 and 303

## 4XX Client Error

Status Code Description 400 Bad Request The request can not be fulfilled because the request contained bad syntax

401 Unauthorized 402 Payment Required This code is intended to be used for a micropayment system, but the specifics for this system are unspecified and this code is rarely used

The client needs to authenticate in order to access this resource

The client is not allowed to access this resource. Generally, the client is authenticated and does not have sufficient permission

The resource was not found, though its existence in the future is possible

The method used in the request is not supported by the resource

The server can not generate content which is acceptable to the client according to the request's "Accept" header

The client must authenticate with the proxy

The client did not complete its request in a reasonable timeframe

The request could not be completed due to a conflict in state (for example, attempting to update a resource when it has changed since last access)

The resource is gone, and will always be gone; the client should not request the resource again

The request is missing its "Content-Length" header, which is required by this resource

The server can not meet preconditions specified in the client request

The request body is larger than the server will process

The request URI is too long for the server to process

The server can not process the request body because it is of an unsupported MIME type

416 Requested Range Not Satisfiable The client has asked for portion of a file that the server can not supply (ie, a range of bytes outside the size of the requested file)

The server can not meet the requirements of the "Expect" header in the request Returned by teapots implementing the HyperText Coffee Pot Control Protocol

The client is being rate-limited; a reference to cannabis culture

The server can not process the request due to semantic errors

The resource is currently locked

The request failed because of a previously-failed request

The client is being rate-limited

Either a single request header is too large, or all the header fields as a group are too large

Used in Nginx logs. Indicates that the server closed the connection without sending any response whatsoever

The request should be retried after performing some action

Windows Parental Controls are turned on and are blocking access to the resource Intended to be used when a resource is being censored or blocked; a reference to Fahrenheit 451

5XX Server Error

451 Unavailable For Legal Reasons (Internet Draft)

450 Blocked by Windows Parental Controls (Microsoft)

Status Code Description

A generic server error message, for when no other more specific message is suitable 500 Internal Server Error

501 Not Implemented The server can not process the request method

The server is a gateway or proxy, and received a bad response from the upstream server (such as a socket hangup) 502 Bad Gateway

> The resource is temporarily unavailable, usually because it is overloaded or down for maintenence The server is a gateway or proxy, and the upstream server did not respond in a reasonable timeframe

504 Gateway Timeout 505 HTTP Version Not Supported The server does not support the request's specified HTTP version 507 Insufficient Storage (WebDAV) The server is out of storage space and can not complete the request

508 Loop Detected (WebDAV) The server has detected an infinite loop while processing the request 509 Bandwidth Limit Exceeded A convention used to report that bandwidth limits have been exceeded, and not part of any RFC or spec
